Bombas de Agua para automotores

Vehículos Livianos y Pesados

Catálogo de Aplicaciones
Actualizado a Julio 2016

Circuito Refrigeración

La bomba de agua es parte de un circuito, por lo que fallas y/o desgastes en otros componentes pueden afectar al funcionamiento normal de la misma.

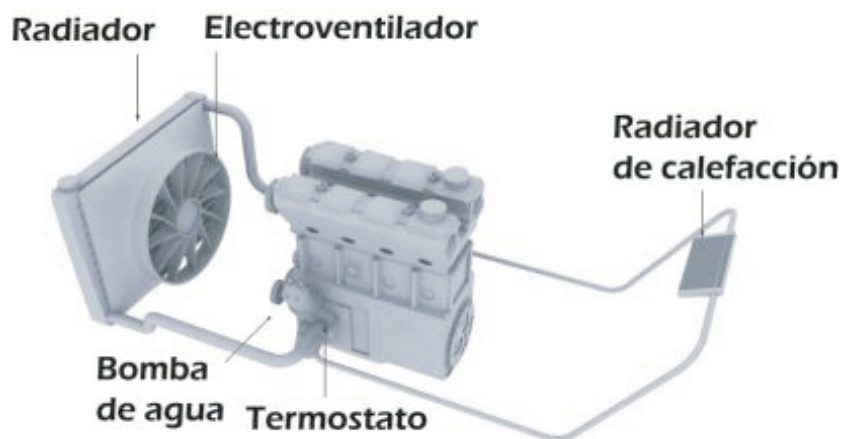

Como todo circuito en el que circulan líquidos a altas temperaturas, las posibilidades de sobrepresiones por recalentamiento, las pérdidas por desgastes de las partes y las fallas por mal funcionamiento de alguna de las partes son normales.

Al momento de colocar una bomba de agua nueva, debe verificar SIEMPRE:

- Termostato y termocontacto
- Tapas de reservorio y radiador
- Mangueras y acoples
- Tensores de correas
- Tensiones de montaje

Limpieza del circuito, evitando que quede óxido alguno en el circuito.

- Utilizar siempre líquido refrigerante original o un reemplazo de la misma calidad.
- El correcto recorrido de la correa.

Diagnóstico de anomalías

Fugas o Pérdidas

Causas

- ★ Incremento de la temperatura por pérdidas del circuito refrigerante.
- ★ Choque térmico (normalmente producido por agregar líquido al circuito de refrigeración con el motor en caliente)

Prevención

- ★ Verificar o sustituir el termocontacto.
- ★ Limpiar el circuito de refrigeración.
- ★ Verificar o sustituir el termostato.
- ★ Verificar que no existan pérdidas en mangueras, uniones y tapas de radiador y/o reservorio.

Tinte / Erosión

Causas

- ★ Utilización de un líquido refrigerante inadecuado o no se limpió correctamente el circuito antes de instalar la nueva bomba de agua.
- ★ Reacción electroquímica por problemas en el circuito eléctrico (generalmente, en la masa)

Prevención

- ★ Usar líquido refrigerante recomendado, nunca agua.
- ★ Limpiar el circuito de refrigeración antes de retirar la bomba de agua defectuosa y llenar el circuito con el nuevo refrigerante.
- ★ Verificar que no haya problemas con la masa del motor.

Óxido o Sarro

Causas

- ★ Suciedad en el circuito refrigerante, por la presencia de óxido, aceite u otro.
- ★ No usar líquido refrigerante correcto (agua, falsos refrigerantes u otro)
- ★ Deterioro del circuito refrigeración.

Prevención

- ★ Limpiar el circuito de refrigeración.
- ★ No utilizar agua.
- ★ Limpiar el circuito de refrigeración antes de retirar la bomba de agua defectuosa y llenar el circuito con el nuevo refrigerante.
- ★ Verificar el estado del circuito de refrigeración y sus partes.

MUY IMPORTANTE

Las empaquetaduras de los vehículos modernos vienen equipadas con sello cerámico, por lo tanto, el rellenado del circuito debe hacerse con el motor en frío.
